breeding cycle and behaviour. The present work is a distillation of the studies and researches on *Sula bassana* in Europe and North America, with frequent reference to the African and Australasian gannets. There is also a chapter on the boobies, all of which have been studied at first hand by the author. Chapter topics are plumage, shape, structure and voice; numbers and distribution; behaviour; ecology; the bird at sea; the gannet family and the order; the gannet and man. There are many tables, maps and a full bibliography. The authoritative text is complemented by John Busby's brilliant and evocative drawings, plus 32 pages of photographs, many unpublished hitherto.

The Birds World Nicolae Sfetcu 2014-11-27
Birds are among the most extensively studied of all animal groups. Hundreds of academic journals and thousands of scientists are devoted to bird research, while amateur enthusiasts (called birdwatchers or, more commonly, birders) probably number in the millions. Birds

are categorised as a biological class, Aves. The earliest known species of this class is *Archaeopteryx lithographica*, from the Late Jurassic period. According to the most recent consensus, Aves and a sister group, the order Crocodylia, together form a group of unnamed rank, the Archosauria. Phylogenetically, Aves is usually defined as all descendants of the most recent common ancestor of modern birds (or of a specific modern bird species like *Passer domesticus*), and *Archaeopteryx*. Modern phylogenies place birds in the dinosaur clade Theropoda. Modern birds are divided into two superorders, the Paleognathae (mostly flightless birds like ostriches), and the wildly diverse Neognathae, containing all other birds.

species, the authors examine the many-and-varied common names and full scientific name, with derivation, translation and a guide to pronunciation. Stories behind the name are included, as well as relevant aspects of biology, conservation and history. Original descriptions, translated by the authors, have been sourced for many species. As well as being a book about names, this is a book about the history of the ever-developing understanding of birds, about the people who contributed to this understanding and, most of all, about the birds themselves. This second edition has been revised to follow current taxonomy and understanding of the relationships between families, genera and species. It contains new taxa, updated text and new vagrants and will be interesting reading for anyone with a love of birds, words or the history of Australian biology and bird-watching.

Exuberant Life William H. Durham 2021-03-22
The terrestrial organisms of the Galápagos Islands live under conditions unlike those anywhere else. At the edge of a uniquely rich mid-ocean upwelling, their world is also free of mammalian predators and competitors, allowing them to live unbothered, exuberant lives. With its giant tortoises, marine iguanas, flightless cormorants, and forests of giant daisies, there's no question that this is a magnificent place. Long before people traversed the Earth, evolution endowed native species with adaptations to these special conditions and to perturbations like El Niño events and periodic droughts. As the islands have grown ever-more connected with humanity, those same adaptations now make its species vulnerable. Today, the islands are best viewed as one big social-ecological system where the ability of each native organism to survive and reproduce is a product of human activity in addition to ecological circumstances. In this book, William

H. Durham takes readers on a tour of Galápagos and the organisms that inhabit these isolated volcanic islands. *Exuberant Life* offers a contemporary synthesis of what we know about the evolution of its curiously wonderful organisms, how they are faring in the tumultuous changing world around them, and how evolution can guide our efforts today for their conservation. The book highlights the ancestry of a dozen specific organisms in these islands, when and how they made it to the Galápagos, as well as how they have changed in the meantime. Durham traces the strengths and weaknesses of each species, arguing that the mismatch between natural challenges of their habitats and the challenges humans have recently added is the main task facing conservation efforts today. Such analysis often provides surprises and suggestions not yet considered, like the potential benefits to joint conservation efforts between tree finches and tree daisies, or ways in which the peculiar

evolved behaviors of Nazca and blue-footed boobies can be used to benefit both species today. In each chapter, a social-ecological systems framework is used to highlight links between human impact, including climate change, and species status today. Historically, the Galápagos have played a central role in our understanding of evolution; what these islands now offer to teach us about conservation may well prove indispensable for the future of the planet.

Boobies Tim Harris 2001-01-01 Explores the physical characteristics, habits, and habitat of boobies.

Pelicans, Cormorants, and their Relatives J. Bryan Nelson 2006-01-26 The pelecaniformes are a large and important group of seabirds, containing many spectacular species. This book addresses the breeding biology of the six

pelecaniform families, which comprise the closely-related core groups (pelicans, cormorants/shags, darters, gannets/boobies) and their more distant relatives, the frigate birds and tropic birds. Many fundamental questions can be addressed through the pelecaniformes: Why do they breed in colonies? What are the links between their feeding methods and their reproduction? What part does territorial and pairing behaviour play in their life-cycles? These and scores of comparable issues, including those related to man, are woven here into a richly interpretative text. The author's approach to the subject is threefold. First, the pelecaniformes are placed within the framework of four discrete disciplines, with chapters on evolutionary relationships, comparative behaviour, ecology, and the birds' relationship with humans. Secondly, each of the six families is discussed, elucidating the range of taxonomy, behaviour, and ecology within each. Finally, we progress to specific level, using the same structure as for

the family accounts. In this way, each of the 60-odd species can be understood not just as discrete units, but as part of their family and order. The book is unique in its coverage of the entire order and in its combination of facts and interpretation. Pelicans, Cormorants, and their Allies will enable readers not only to identify the many spectacular species which make up this large and important group of seabirds, but also to understand their breeding biology.

Migratory Tactics and Wintering Areas of Northern Gannets (*Morus Bassanus*)

Breeding in North America David A. Fifield
2014 Migration has evolved to allow organisms to undertake life-history functions in the most appropriate place at the most appropriate time. Migration creates seasonal ecological linkages that have important implications for survival, population dynamics, response to climate change, and conservation. Although advances in bird-borne tracking technology have promoted knowledge of avian migratory ecology, major

information gaps remain for most avian species, including seabirds. Ours is the first study to electronically track the migration and wintering of Northern Gannets (*Morus bassanus*; hereafter "gannets") from almost all of their North American breeding range, in multiple years and with multiple tracks from individual birds. Gannets used distinct wintering areas and aggregated in several major hotspots. Most adults remained along the northeast North American coast, and breeding populations displayed only weak migratory connectivity. Unexpectedly, the Gulf of Mexico was revealed to be an important wintering area for adults. Individual gannets displayed remarkable winter-site fidelity with extensive range overlap across years. Timing, rates of movement, and use of stopovers during migration depended strongly on winter destination and also on sex, colony, and year. Females left the colony prior to males in fall, but, contrary to expectation, earlier spring arrival of males was not detected.

Variation in seasonal constraints was emphasized by faster and shorter spring migrations compared with fall. Migratory duration, distance, and timing of arrival and departure from the winter grounds were all repeatable, suggesting strong individual conservation in these traits, while variability in the timing of colony departure and arrival, migratory speed, and the extent of stopovers en route imply greater environmental influences on these behaviors. Three of 46 gannets displayed a radically different round-trip migration and overwinter strategy by undertaking the first recorded (and repeated), round-trip trans-Atlantic migrations to the coast of Africa, where gannets breeding in Europe overwinter. Trans-Atlantic crossings were as rapid as 5 days. Gannets breeding at all of the North American colonies located in easternmost Canada in Newfoundland made trans-Atlantic migrations. This contrasts with no such crossings by a much larger sample of gannets breeding in the

species' largest North American colony (Bonaventure Island) in the Gulf of St. Lawrence. Similar trans-Atlantic migrations have not been recorded in the well-studied European colonies. The discovery of this trans-Atlantic connection has implications for interaction, connectivity, and phylogeographic radiation between the eastern and western Atlantic populations and suggests that migratory animals have a surprising capacity for successful movement beyond their known migrations. We discuss our results in the broader context of seabird migration. The observed patterns of migratory timing and scale-dependent connectivity present a novel opportunity to assess the ecological and conservation implications during migration and on the wintering grounds. The overall weak connectivity suggests that gannets, as a population, may have the capacity to respond to modest environmental change. However, the repeatability of some characters implies that any response may be slow because the population

will respond, but not necessarily the individuals. The lability of migratory tactics in the population as a whole combined with remarkable individual consistency in some, but not all, migration parameters offers rare insight into the relative contributions of genetic and environmental factors controlling migration.

Monitoring the State of the St. Lawrence River

Gilles Chapdelaine 2005 Six government partners - Environment Canada, Fisheries and Oceans Canada, the Canadian Space Agency, Parks Canada Agency, the Ministère du Développement durable, de l'Environnement et des Parcs du Québec, the Ministère des Ressources naturelles et de la Faune du Québec - and Stratégies Saint-Laurent, a nongovernmental organization that works actively with riverside communities, are pooling their expertise and efforts to provide Canadians with information on the state of the St. Lawrence and long-term trends affecting it. To this end, environmental indicators have been

developed on the basis of data collected as part of each organization's ongoing environmental monitoring activities. This fact sheet illustrates why the Northern Gannet, a seabird whose expansive feeding grounds and a diet rich in fish can provide information on the abundance of its prey and the degree of contamination of the ecosystem, was chosen as a sentinel species (or "bioindicator") of the state of the Gulf of St. Lawrence.

Both blue-foot siblings often survive and fledge, but when parents provide insufficient food, senior increases its aggression and junior starves to death or gets killed by adult neighbors while seeking adoption in their nests. In contrast, brown booby parents bring less food to their broods and their senior chicks are unconditionally intolerant and violent; they attack their sibling at every opportunity and toss it out of the nest, to certain death. The behavioral roles of booby family members - including conditional sharing, siblicide, and parental passivity - are explained by Hamilton's theory of inclusive fitness and kin selection, which also applies to humans"--

Paleogene Fossil Birds Gerald Mayr 2022-02-12 This second, completely revised edition of "Paleogene fossil birds" gives a comprehensive, updated overview of the avian fossil record from a geological period that lasted from the end-Cretaceous mass extinction event (66 million years ago) to the end of the Oligocene epoch (23 mya). Paleogene avifaunas are highly diversified and not only feature unusual archaic groups without close living relatives but also offer unique insights into the evolution and biogeographic history of extant birds. The main body of the book constitutes an in-depth survey of the known diversity of Paleogene avifaunas. The reader is introduced into basic skeletal features of extinct avian taxa, with these fossil forms being placed into a phylogenetic context in the light of current hypotheses on the interrelationships of extant birds. The geographical and temporal

occurrences of the various fossil groups are outlined and their evolutionary significance is discussed. Concluding sections inform more general aspects of Paleogene avifaunas, such as possible causes of major faunal changes. In addition to being a reference work for the early evolution of modern birds from a paleornithological perspective, the present work also enables researchers in other fields of vertebrate paleontology to gain an improved understanding of Paleogene ecosystems. Numerous color photos of representative specimens furthermore make the new edition attractive to a wider audience interested in the avian fossil record.

The Birds of Africa: Volume I 2020-06-25

Universally recognised as by far the most authoritative work ever published on the subject, The Birds of Africa is a superb multi-contributor reference work, with encyclopaedic species texts, stunning paintings of all species and numerous subspecies, hundreds of informative

line drawings, detailed range maps, and extensive bibliographies. Each volume contains an Introduction that brings the reader up to date with the latest developments in African ornithology, including the evolution and biogeography of African birds. Diagnoses of the families and genera, often with superspecies maps, are followed by the comprehensive species accounts themselves. These include descriptions of range and status, field characters, voice, general habits, food, and breeding habits. Full bibliographies, acoustic references, and indexes complete this scholarly work of reference. This first volume in the series deals comprehensively with Ostrich, albatrosses, petrels and shearwaters, storm-petrels, penguins, divers, grebes, tropicbirds, boobies, cormorants, darter, pelicans, frigatebirds, herons, Hamerkop, storks, Shoebill, ibises and spoonbills, flamingos, swans, geese and ducks, and diurnal birds of prey. The Guga Hunters Donald S. Murray
2018-06-02 This Scottish Highlands history celebrates the traditional Gaelic bird hunt undertaken each year on the island of Sula Sgeir north of the Outer Hebrides. Every year, ten men from Ness, at the northern tip of the Isle of Lewis, sail north-east for some forty miles to a remote rock called Sula Sgeir. Their mission is to catch and harvest the guga; the almost fully grown gannet chicks nesting on the two-hundred-foot-high cliffs that circle the tiny

island, which is barely half a mile long. After spending a fortnight in the arduous conditions that often prevail there, they return home with around two thousand of the birds, pickled and salted and ready for the tables of Nessmen and women both at home and abroad. The Guga Hunters tells the story of the men who voyage to Sula Sgeir each year, capturing their way of life and the drama of their exploits. They speak of the laughter that seasons their time together on Sula Sgeir, as well as the dangers they have faced. Delving deep into the social history of Ness, local historian Donald S. Murray also reveals the hunt's connections to the traditions of other North Atlantic countries. Told in his district's poetry and prose, Murray shows how the spirit of a community is preserved in this truly unique tradition.
