Super Linear Algebra W. B. Vasantha
Kandasamy 2008 Super Linear Algebras are
built using super matrices. These new structures

can be applied to all fields in which linear
algebras are used. Super characteristic values
exist only when the related super matrices are
super square diagonal super matrices. Super

diagonalization, analogous to diagonalization is obtained. These newly introduced structures can be applied to Computer Sciences, Markov Chains, and Fuzzy Models.

Non Associative Algebraic Structures Using Finite Complex Numbers

W.B. Vasantha Kandasamy, Florentin Smarandache 2012 The authors have used the concept of finite complex modulo integers to construct non associative algebraic structures like groupoids, loops and quasi-loops. Using these structures we built non associative complex matrix groupoids and complex polynomial groupoids. The authors suggest over 300 problems and some are at the research level.

Groupoids of Type I and II Using $[0, n)$ W. B. Vasantha Kandasamy Study of algebraic structures built using $[0, n)$ looks to be one of interesting and innovative research. Here we define two types of groupoids using $[0, n)$, both of them are of infinite order. It is an open conjecture to find whether this new class of

groupoids satisfy any of the special identities like Moufang identity or Bol identity and so on.

Special Type of Topological Spaces Using

$[0, n)$ W. B. Vasantha Kandasamy 2015-02-15 In this book authors for the first time introduce the notion of special type of topological spaces using the interval $[0, n)$. They are very different from the usual topological spaces. Algebraic structure using the interval $[0, n)$ have been systemically dealt by the authors. Now using those algebraic structures in this book authors introduce the notion of special type of topological spaces. Using the super subset interval semigroup special type of super interval topological spaces are built.

Subset Polynomial Semirings and Subset Matrix Semirings W. B. Vasantha Kandasamy In this book the authors introduce the new notions of subset polynomial semirings and subset matrix semirings. Solving subset polynomial equations is an interesting exercise. Open problems about the solution set of subset polynomials are proposed.

Study of Natural Class of Intervals Using $(-\infty, \infty)$ and $(\infty, -\infty)$ W. B. Vasantha Kandasamy, Florentin Smarandache, D. Datta, H. S. Kushwaha, P. A. Jadhav 2011 In this book the authors introduce and study the properties of natural class of intervals built using $(-,)$ and $(, -)$. The operations on these matrices with entries from natural class of intervals behave like usual reals. So working with these interval matrices takes the same time as usual matrices. Hence, when applying them to fuzzy finite element

methods or finite element methods the determination of solution is simple and time saving.

Interval Semirings W. B. Vasantha Kandasamy, Florentin Smarandache 2011 In this book the new notion of interval semirings are introduced. New structures like interval groups are used to construct interval group semirings. Further non-associative interval semirings are constructed using loops and groupoids. We have given 284 examples, 118 problems are proposed & some of them at the research level. The main keywords are interval semirings, interval groups, interval matrix semirings, interval groupoid semirings, neutrosophic interval semirings, and loop interval semirings.

Neutrosophic Components Semigroups and

Multiset Neutrosophic Components Semigroups Vasantha W.B. Neutrosophic components (NC) under addition and product form different algebraic structures over different intervals. In this paper authors for the first time define the usual product and sum operations on NC. Here four different NC are defined using the four different intervals: $(0, 1)$, $[0, 1)$, $(0, 1]$ and $[0, 1]$.

Plithogenic Graphs W. B. Vasantha Kandasamy

The plithogenic set is a generalization of crisp, fuzzy, intuitionistic fuzzy, and Neutrosophic sets, it is a set whose elements are characterized by many attributes' values. This book gives some possible applications of plithogenic sets defined by Florentin Smarandache (2018). The authors have defined a new class of special type of graphs which can be applied for plithogenic models.

Smarandache Fuzzy Algebra W. B. Vasantha

Kandasamy 2003 The author studies the Smarandache Fuzzy Algebra, which, like its predecessor Fuzzy Algebra, arose from the need to define structures that were more compatible with the real world where the grey areas mattered, not only black or white. In any human field, a Smarandache n -structure on a set S means a weak structure $\{w(0)\}$ on S such that there exists a chain of proper subsets $P(n-1)$ in

$P(n-2)$ in $P(2)$ in $P(1)$ in S whose corresponding structures verify the chain $\{w(n-1)\}$ includes $\{w(n-2)\}$ includes $\{w(2)\}$ includes $\{w(1)\}$ includes $\{w(0)\}$, where 'includes' signifies 'strictly stronger' (i.e., structure satisfying more axioms). This book is referring to a Smarandache 2-algebraic structure (two levels only of structures in algebra) on a set S , i.e. a weak structure $\{w(0)\}$ on S such that there exists a proper subset P of S , which is embedded with a stronger structure $\{w(1)\}$. Properties of Smarandache fuzzy semigroups, groupoids, loops, bigroupoids, biloops, non-associative rings, birings, vector spaces, semirings, semivector spaces, non-associative semirings, bisemirings, near-rings, non-associative near-ring, and binear-rings are presented in the second part of this book together with examples, solved and unsolved problems, and theorems. Also, applications of Smarandache groupoids, near-rings, and semirings in automaton theory, in error

correcting codes, and in the construction of S -sub-biautomaton can be found in the last chapter.

Linguistic Semilinear Algebras and Linguistic Semivector Spaces W. B. Vasantha Kandasamy 2022-12-15 Algebraic structures on linguistic sets associated with a linguistic variable are introduced. The linguistics with single closed binary operations are only semigroups and monoids. We describe the new notion of linguistic semirings, linguistic semifields, linguistic semivector spaces and linguistic semilinear algebras defined over linguistic semifields. We also define algebraic structures on linguistic subsets of a linguistic set associated with a linguistic variable. We define the notion of linguistic subset semigroups, linguistic subset monoids and their respective substructures. We also define as in case of deals in classical semigroups, linguistic ideals in linguistic semigroups and linguistic monoids. This concept of linguistic ideals is extended to

Interval Linear Algebra W. B. Vasantha Kandasamy, Florentin Smarandache 2010

Interval Arithmetic, or Interval Mathematics, was developed in the 1950s and 1960s as an approach to rounding errors in mathematical computations. However, there was no methodical development of interval algebraic structures to this date. This book provides a systematic analysis of interval algebraic structures, viz. interval linear algebra, using intervals of the form $[0, a]$.

Linear Algebra and Smarandache Linear

Algebra W. B. Vasantha Kandasamy 2003 In this

book the author analyzes the Smarandache linear algebra, and introduces several other concepts like the Smarandache semilinear algebra, Smarandache bilinear algebra and Smarandache anti-linear algebra. We indicate that Smarandache vector spaces of type II will be used in the study of neutrosophic logic and its applications to Markov chains and Leontief Economic models ? both of these research topics have intense industrial applications. The Smarandache linear algebra, is defined to be a Smarandache vector space of type II, on which there is an additional operation called product, such that for all a, b in V , ab is in V . The Smarandache vector space of type II is defined to be a module V defined over a Smarandache ring R such that V is a vector space over a proper subset k of R , where k is a field.

Smarandache Special Definite Algebraic Structures W. B. Vasantha Kandasamy 2009-01-01 We study these new Smarandache algebraic structures, which are defined as structures which have a proper subset which has

a weak structure. A Smarandache Weak Structure on a set S means a structure on S that has a proper subset P with a weaker structure. By proper subset of a set S , we mean a subset P of S , different from the empty set, from the original set S , and from the idempotent elements if any. A Smarandache Strong Structure on a set S means a structure on S that has a proper subset P with a stronger structure. A Smarandache Strong-Weak Structure on a set S means a structure on S that has two proper subsets: P with a stronger structure, and Q with a weaker structure.

Smarandache Special Elements in Multiset

Semigroups W. B. Vasantha Kandasamy Authors in this book study the notion of Smarandache element in multiset semigroups. It is important to keep on record that we define four operations on multisets viz. $+$, \times , union and intersection in a free way. Thus all sets finite or infinite order contribute to infinite order multisets and the semigroup under any of these operations is of infinite order.

Bialgebraic Structures and Smarandache

Bialgebraic Structures W. B. Vasantha Kandasamy 2003-01-01 Generally the study of algebraic structures deals with the concepts like groups, semigroups, groupoids, loops, rings, near-rings, semirings, and vector spaces. The study of bialgebraic structures deals with the study of bistructures like bigroups, biloops, bigroupoids, bisemigroups, birings, binear-rings, bisemirings and bivector spaces. A complete study of these bialgebraic structures and their

Smarandache analogues is carried out in this book. For examples: A set $(S, +, *)$ with two binary operations $+$ and $*$ is called a bisemigroup of type II if there exists two proper subsets S_1 and S_2 of S such that $S = S_1 \cup S_2$ and $(S_1, +)$ is a semigroup. $(S_2, *)$ is a semigroup. Let $(S, +, *)$ be a bisemigroup. We call $(S, +, *)$ a Smarandache bisemigroup (S-bisemigroup) if S has a proper subset P such that $(P, +, *)$ is a bigroup under the operations of S . Let $(L, +, *)$ be a non empty set with two binary operations. L is said to be a biloop if L has two nonempty finite proper subsets L_1 and L_2 of L such that $L = L_1 \cup L_2$ and $(L_1, +)$ is a loop, $(L_2, *)$ is a loop or a group. Let $(L, +, *)$ be a biloop we call L a Smarandache biloop (S-biloop) if L has a proper subset P which is a bigroup. Let $(G, +, *)$ be a non-empty set. We call G a bigroupoid if $G = G_1 \cup G_2$ and satisfies the following: $(G_1, +)$ is a groupoid (i.e. the operation $+$ is non-associative), $(G_2, *)$ is a semigroup. Let $(G, +, *)$ be a non-empty set with $G = G_1 \cup G_2$, we call G

a Smarandache bigroupoid (S-bigroupoid) if G_1 and G_2 are distinct proper subsets of G such that $G = G_1 \cup G_2$ (neither G_1 nor G_2 are included in each other), $(G_1, +)$ is a S-groupoid, $(G_2, *)$ is a S-semigroup. A nonempty set $(R, +, *)$ with two binary operations $+$ and $*$ is said to be a biring if $R = R_1 \cup R_2$ where R_1 and R_2 are proper subsets of R and $(R_1, +, *)$ is a ring, $(R_2, +, *)$ is a ring. A Smarandache biring (S-biring) $(R, +, *)$ is a non-empty set with two binary operations $+$ and $*$ such that $R = R_1 \cup R_2$ where R_1 and R_2 are proper subsets of R and $(R_1, +, *)$ is a S-ring, $(R_2, +, *)$ is a S-ring.

Gbolahan 2009 This monograph is a compilation of results on some new Smarandache concepts in Smarandache;groupoids, quasigroups and loops, and it pin points the inter-relationships and connections between and among the various Smarandache concepts and notions that have been developed. This monograph is structured into six chapters. The first chapter is an introduction to the theory quasigroups and loops with much attention paid to those quasigroup and loop concepts whose Smarandache versions are to be studied in the other chapters. In chapter two, the holomorphic structures of Smarandache loops of Bol-Moufang type and Smarandache loops of non-Bol-Moufang type are studied. In the third chapter, the notion of parastrophe is introduced into Smarandache quasigroups and studied. Chapter four studies the universality of some Smarandache loops of Bol-Moufang type. In chapter five, the notion of Smarandache isotopism is introduced and studied in Smarandache quasigroups and

Smarandache Near-Rings W. B. Vasantha

Kandasamy 2002 Generally, in any human field, a Smarandache Structure on a set A means a weak structure W on A such that there exists a proper subset B in A which is embedded with a stronger structure S . These types of structures occur in our everyday life, that's why we study them in this book. Thus, as a particular case: A Near-Ring is a non-empty set N together with two binary operations '+' and '.' such that $(N, +)$ is a group (not necessarily abelian), (N, \cdot) is a semigroup. For all a, b, c in N we have $(a + b) \cdot c = a \cdot c + b \cdot c$. A Near-Field is a non-empty set P together with two binary operations '+' and '.' such that $(P, +)$ is a group (not necessarily abelian), $(P \setminus \{0\}, \cdot)$ is a group. For all $a, b, c \in P$ we have $(a + b) \cdot c = a \cdot c + b \cdot c$. A

Smarandache Near-ring is a near-ring N which has a proper subset P in N , where P is a near-field (with respect to the same binary operations on N).

Introduction to Bimatrices W. B. Vasantha

Kandasamy 2005 Generally any real-world

problem is not always solvable, because in that not only a percentage of uncertainty is present, but also, a certain percentage of indeterminacy is present. The presence of uncertainty has been analyzed using fuzzy logic. In this book the amount of indeterminacy is being analyzed using neutrosophic logic. Most of these models use the concept of matrices. Matrices have certain limitation; when the models are time-dependent and any two experts opinions are being studied simultaneously, one cannot compare both of them at each stage. The new concept of bimatrices would certainly cater to these needs. A bimatrix $AB = A_1 \cup B_2$, where A_1 and A_2 are distinct matrices of arbitrary order. This book introduces the concept of bimatrices, and studies several notions like bieigen values, bieigen vectors, characteristic bipolynomials, bitransformations, bioperators and bidiagonalization. Further, we introduce and explore the concepts like fuzzy bimatrices, neutrosophic bimatrices and fuzzy neutrosophic

bimatrices, which will find its application in fuzzy and neutrosophic logics.

Algebraic Structures Using Subsets W. B. Vasantha Kandasamy, Florentin Smarandache 2011 "[The] study of algebraic structures using subsets [was] started by George Boole. After the invention of Boolean algebra, subsets are not used in building any algebraic structures. In this book we develop algebraic structures using subsets of a set or a group, or a semiring, or a ring, and get algebraic structures. Using group or semigroup, we only get subset semigroups. Using ring or semiring, we get only subset semirings. By this method, we get [an] infinite

number of non-commutative semirings of finite order. We build subset semivector spaces, [and] describe and develop several interesting properties about them."--
